Abstract (en)

[origin: DE102006001532A1] The circuit breaker (10) has a common switching chamber (12), which is arranged in an insulated gas filled housing. A partition unit (20) made of an insulating material is arranged in the region between conductors (16) in the chamber. A pressure balance is produced between the regions that are separated by the partition unit. The products of decomposition developed through switching electric arc remain in the respective regions.
