Abstract (en)

[origin: WO2007087881A1] The invention relates to a rotary drive for an electrical switch (100) with toggle-lever actuation. The essence of the invention consists in a rotatably mounted operative connection in the form of a frame (20) or a clip (20'), whose rotation brings about the movement of the toggle lever (120), or the toggle lever (120) can be actuated by the movement of the operative connection. The toggle lever (120) (and therefore the lock of the switch) can be actuated into the respective end position via a driver arrangement between a shaft (42), which is guided in a mounting plate (80), and the operative connection.
