Abstract (en)  
The invention relates to a smoking room in which arranged in an inner enclosure (14) demarcated by an outer partition (1) there air purifiers (2) absorbing the air contaminated with smoke, the outer partition being formed by two opposite and separated U shaped closing elements (9,10) generating two accesses (13). Inside the inner enclosure (14) there is an air case (5) absorbing the air of the inner enclosure (14) cleaned by the purifiers (2) and driving it to the upper area in which the air is divided into a current towards the inner enclosure (14), generating an air ceiling (22), preventing the air not cleaned by the purifiers (2) from leaving, and into a current towards the outside of the room generating a decompensation between the inner enclosure (14) and the outside of the room, forcing the circulation of the air from the outside to the inner enclosure (14) through the accesses (13) and the upper part not covered by the air ceiling (22) at this time.
