Abstract (en)

[origin: WO2007082543A1] The present invention provides a container for storing a blister package and for managing medication with a pharmaceutical composition comprised in the blister package. The container comprises a housing which forms a compartment for the blister package, means for indicating towards a user an appropriate time of accessing the blister package, and means for detecting a user's access to a blister package in the compartment. The blister package is moved into and out of the compartment by means of an ejection structure to which the blister package may be fixed. The ejection structure facilitates an enhanced handling of the blister package during insertion and removal of the blister package and facilitates a more accurate indication of a user's access to the blister package.
