Abstract (en)

[origin: EP1974830A1] The nozzle has a rigid body (1) provided with an external air distribution channel (2), and an elastically deformable sleeve (4) provided with a front lip that is arranged against a distribution orifice. The lip is inversely displaced between a stable closing state and an opposed opening state of the orifice. The sleeve is connected on the body through maintaining units. The maintaining units limit axial displacements of a rear part (4b) and other part of the sleeve, respectively, where the other part is arranged between the rear part and lip of the sleeve.
