Abstract (en)

A vehicle toll charge system includes a transponder with GPS function, a local controller taking and storing an image of a vehicle driving in a charging zone, and a central computer system. The central computer system executes a matching of charging position information and transaction information transmitted from the transponder and identification information of a vehicle stored in itself to check whether or not the charging on a vehicle loading the transponder is possible. When the charging is judged to be impossible, the central computer system requests a transmitting of an image of the vehicle loading the transponder from the local controller. By this configuration, a vehicle toll charge system and method are provided, which can be installed in a small cost without large scale constructions such as a gantry for setting roadside apparatuses for obtaining information from vehicles in a charging zone.
