Abstract (en)
[origin: WO2007073833A1] The invention relates to a coating unit (2) for transferring imaging or covering layers from a transfer film (5) to a printed material. Said coating unit should be flexible thus enabling the integrated production of complex printed material. In particular, overprinting of film coatings should be able to be carried out in a problem-free manner. One or several discharge devices (E, EI), which are connected to the film application module (FA), are used for modifying the surface tension of the transfer film (5) or the printed sheet in the rotary sheet printing machine ensuring the printing and also the film-coated surfaces of the printed sheet are of high quality.
