Abstract (en)
[origin: WO2007082616A1] In a fuel delivery device (1) for supplying an internal combustion engine (3) of a motor vehicle with fuel from a fuel tank (2), a pressure sensor (14) is arranged within the fuel tank (2) and is connected to a section, which is guided within the fuel tank (2), of a feed line (6). In this way, the pressure sensor (14) is remote from the internal combustion engine (3) and is therefore subjected to only very low thermal and mechanical loads. The fuel delivery line (1) is therefore of particularly cost-effective design.
