Abstract (en)
[origin: WO2007085444A1] A kit serves the purpose of converting a luminaire with a linear fluorescent lamp (1) with a base at both ends from inductive to electronic high-frequency operation. This kit is provided with two end parts (10, 11), which can be plugged onto contact pins of the fluorescent lamp bases and can be electrically connected to one another, and with an electronic ballast (15), whose component parts are accommodated in at least one of the two end parts (10, 11). These end parts (10, 11) are in each case in the form of a sleeve and can be electrically connected to one another via at least two lines (20, 21). These high-frequency lines (20, 21) run along the fluorescent lamp (1) and are formed or arranged such that no or only minimal electromagnetic interference voltages are transmitted into the power supply system.
