Abstract (en)
[origin: WO2007076013A2] In homocysteine immunoassays, it is known that the measured values are dispersed due to the influence of inhibiting substances present in a biological sample on the immunoreaction. The present invention provides among other things a method whereby the influence of the immunoreaction inhibiting substances is easily and efficiently suppressed or eliminated, and also provides a kit used for such a method. The influence of the immunoreaction inhibiting substances is suppressed or eliminated when the homocysteine contained in biological samples is reacted with an antibody in the presence of extrinsic polyanion.
