Abstract (en)
[origin: FR2896611A1] The player has an audiophonic content digital memory (6) e.g. flash memory, in which an audiophonic content is stored in its manufacture phase. The memory is accessed by an electronic reading circuit controlled by a control interface (10) for delivering an audiophonic signal corresponding to the memory content on out ports (12). A sign has information describing the content of the memory. The player is designed for preventing writing another audiophonic content in the memory. The memory is accessible only by the circuit for reading the content of the memory.
