Abstract (en)

[origin: WO2007073760A1] A telecommunications system comprises a mobile station 3 connected to a mobile switching centre (MSC) 5 over an air interface 7. The mobile switching centre (MSC) 5 is connected to a service control point (SCP) 9. The mobile switching center (MSC) 5 is arranged to set up a call with a destination subscriber unit 13 via a public switched telephone network (PSTN) 15. An IP-based communication link between the service control point (SCP) 9 and the destination subscriber unit 13 is established as follows. During a call set-up procedure between the calling subscriber (mobile station 3) and the destination subscriber unit 13, the IP address of the required service (i.e. of the relevant service control point 9) is transmitted to the destination subscriber unit 13 via the MSC 5 by means of a circuit switched protocol. Alternatively the IP address of the destination subscriber unit 13 is transmitted to the mobile switching center (MSC) 5 in a signaling message relating to a connect procedure, towards the SCP 9 of the calling party. The transfer of the IP address between the service control point (SCP) 9 and the destination subscriber unit 13 facilitates IP based communication to take place directly between the service control point (SCP) 9 and the destination subscriber unit 13, initiated either by the service control point (9) or the destination subscriber unit (13).
