Abstract (en)
[origin: EP1978617A1] The device (10) has a diode arranged between an input-sided connector (20) and a load (14) e.g. car radio, and formed by a parasitic diode (24) of a semiconductor switch (26). The parasitic diode is arranged parallel to a switching path (28) of the switch and is connected during correct polarity of the source in a forward direction and during wrong polarity in a reverse direction. The switch is controlled depending on the polarity of the source such that the switch is interconnected with the correct polarity for bypassing the parasitic diode by the path and is locked with the wrong polarity.
