Abstract (en)
[origin: DE102005046648A1] The transmission has a synchronization device (9) assigned to two adjacent output gearwheels that mesh with respective input gear wheels of input shafts. The synchronization device is switched between four switching positions. The device does not connect the output gearwheels to an output shaft (4) in one switching position. The device connects only one of the output gearwheels to the output shaft in other and fourth switching positions, and connects both output gearwheels to the output shaft in the third switching position.
