Abstract (en)  
[origin: WO2007080043A1] The invention relates to a cooking appliance door comprising at least one door aeration opening (50), on at least one side of the cooking appliance door, for admitting air into the inner chamber of the door (17) for cooling purposes and at least one door ventilation opening (1) for evacuating air from the inner chamber of the door (17). An air conducting device (51, 52) for conducting the air circulating inside the door inner chamber (17) is arranged in the door inner chamber (17). Advantageously, there is also a lateral door aeration opening (50) which allows air to enter into the area of both lower thirds of the door inner chamber (17). A flow of air can be guided by said type of air conducting devices and/or air paths, also in areas of the door inner chamber, for example, in a lower and a central lower area, such that also such areas can be cooled by the air flow.
