Abstract (en)
   [origin: WO2007088237A1] Access control is provided for a data processing terminal having various resources and capable of executing arbitrary
   computer executable applications using the resources. A set of conditional access control constraints is maintained for defining permissible
   combinations of the resources usable in conjunction by the applications. The applications are allowed to run only within the constraints of
   permissible combinations of resources used by the applications that are run in conjunction. The constraints are defined using access logs assigned
   to different access objects and using service identifiers stored into access logs corresponding to services used. Propositional logics are applied to
   determine allowable combinat ions of resources and / or services usable in conjunction.
