Abstract (en)

[origin: WO2007088308A1] The invention relates to an electrical heating device, essentially by radiation, comprising a heater formed by a high-temperature resistive element, said heater being confined in an envelope, usually made of metal, the front part of which is for example formed by a grid for discharging the emitted radiation, preferably in honeycomb form, said device being characterized in that said heater comprises at least one thermally and mechanically resistant glass plate covered with a low-emissivity resistive layer, said layer being configured in such a way that the power per unit area generated by the heater is between 5 000 W/m² and 35 000 W/m². The invention also relates to said heater.
