Abstract (en)

[origin: EP1980466A1] The method involves detecting a vehicle type and presence of passengers on a loading and unloading platform or in a cabin if the vehicle is the cabin, when the vehicle is in upstream of the platform in moving direction of an aerial carrier-tractor cable. A motor is controlled during vehicle displacement to drive the cable at low and high moving speeds if the vehicle is the cabin and a seat, and in case of presence and absence of the passengers, respectively. The detection and the motor control are carried out during passage of the vehicle along the platform of upstream and downstream stations.
