Abstract (en)

[origin: WO2007090301A1] The apparatus for displaying goods has a horizontally arranged support beam (1') with, in first instance, first receptacles (10, 100) which extend along the support beam (11) and in which first carrier elements (3) which can be displaced along the support beam (11) can be suspended. In addition, the support beam (11) has a second receptacle (S) which extends along the support beam (1') and in which second carrier elements (4) which can likewise be displaced along the support beam (1') can be suspended. Finally, third receptacles (120) are provided on the support beam (11), which third receptacles are in the form of two grooves (120) which are each designed as a recess and extend along the support beam (11) and into which running rollers (6) can be inserted, on which running rollers third carrier elements (5) which can be displaced along the support beam (11) by means of roller holders (69) are fixed. The support beam (11) comprises two profiled rails (1) which are joined to one another with mirror-image symmetry, and the second receptacle (S) is a gap between the two profiled rails (1). The two profiled rails (1) which are joined to one another to form a support beam (11) are held together in a releasable manner by means of connecting parts (24).
