Abstract (en)

A web material winding machine (100) includes a core tube storage tank (1), a guiding unit (2), a transmission means (3), a web material feeding assembly (4), a gripping assembly (5) and a second gluing mechanism (6). A core tube (300) is glued with initial glue and conveyed from the guiding unit (2) to the transmission means (3). Meanwhile, the web material (200) is fed by the web material feeding assembly (4) to the transmission means (3) at a normal speed. The transmission means (3) pushes the core tube (300) to move through a transporting passage (34) to the gripping assembly (5) and the web material (200) is stuck to the core tube (300). The web material (200) winds around the core tube (300) at the winding region (53). When the winding is nearly completed, a new core tube (300) is conveyed to the transporting passage (34) and interferes the speeding of web material (200), causing the web material (200) to tear along the perforation line. A tail glue is applied to the completed core tube (400) by the second gluing mechanism (6) and a roll (400) is produced.
