Abstract (en)
[origin: EP1983488A2] The system has a monitoring sensor and/or signal generator attached to a board computer (BC) of automatic concrete pumps and for detecting operating conditions. A data transmission system communicates between the board computer and a central processor. A software routine is provided in the central processor for combining position data of on-board position determination systems e.g. global positioning systems. The sensor and/or signal generator includes an evaluation routine for automatic determination of a correlation window for site-based operating conditions and position data. An independent claim is also included for a method for computer-aided capturing of work processes of automatic concrete pumps.
