Abstract (en)  
[origin: US2009019780A1] A device for displaceably holding a glass pane (1) in a sliding rail has at least one fastening part (2) to which a hot-melt adhesive cushion (7) is fitted and which has at least one locking element (10, 11). Furthermore, there is an elongate holding rail (3) which can be brought into engagement with the or each locking element (10, 11). The or each locking element (10, 11) can be moved between a locking position, in which the or each fastening part (2) is connected fixedly to the holding rail (3), and a release position in which the engagement with the holding rail (3) is released and the glass pane (1) can be removed from the holding rail (3). As a result, repair due to wear of the holding rail (3) is less cost-intensive, since the glass pane (1) is connected releasably to the holding rail (3).
