Abstract (en)
[origin: EP1985198A1] The device has a container (1) e.g. jar, containing a product, and having a free edge (15) defining a distribution orifice (16). A cap (2) is mounted on the container between closing and opening positions of the orifice. A switch (5) changes the state of sensory stimulation unit (3) e.g. lamp. A shoulder (13) communicates a supply source with the unit (3) during displacement of the cap from closing position towards opening position. The edge and the shoulder extend along axially in the closing position, and the shoulder is axially moved relative to the orifice.
