Abstract (en)
[origin: US2008264448A1] A method for performing wash cycles in a dishwasher comprising factory includes presetting the dishwasher to an adapted wash cycle as a default cycle, the adopted wash cycle being adapted to a combination product including a detergent agent and at least one of a water-softening agent and a rinse agent. A wash cycle is selected using a control element. Using a cycle controller, the adapted wash cycle is performed until a filling of at least one reservoir with a rinse aid or a water softener salt. Using the cycle controller, a predetermined number of standard wash cycles are performed after the filling of the at least one reservoir.
