Abstract (en)

The invention relates to the device for producing a textile of defined thickness by folding a two-dimensional textile into folds, which comprises a group of forming disks arranged on the first working shaft and a group of forming disks arranged on a second working shaft, which is parallel with the first working shaft. Each of the forming disks on its periphery is equipped with a system of working protrusions and working interspaces, while the forming disks mounted on the first working shaft are arranged against the forming disks mounted on the second working shaft, while the working protrusions of forming disks on the first working shaft extend at least partially into the working interspaces of forming disks on the second working shaft and vice versa, and on the output from the forming space formed between the forming disks on the first working shaft and forming disk on the second working shaft there is performed the off-take of the folded textile formed at least by one first guiding surfaces and at least one second guiding surfaces.
