Abstract (en)
[origin: WO2007098822A1] The invention relates to a multi-component cartridge for jointly dispensing a plurality of components which are stored separately from one another in the multi-component cartridge (1), having a tubular outlet (3), in which a tubular inner outlet (8) is located, and having a closure component (9), which can be screwed onto the outlet (3) and by means of which the outlets (3, 8) can be closed. In order to create such a cartridge which does not compress the outlets of the components upon closure, the application proposes that the closure component (9) has an intercepting helix (12) which has the inner outlet (8) coming into abutment against its inside when the closure component (9) is screwed onto the outlet (3) and which centres the inner outlet (8) in the intercepting helix (12) as the screwing-on action continues.
