Abstract (en)
The invention relates to a prefabricated rail supporting element for supporting a rail for rail-bound vehicles, having a longitudinal elastic body with a bottom portion having a bottom and side portions having a top side forming a rail receiving opening extending along the length of said element. The rail receiving opening is adapted to receive the rail while leaving a head of the rail exposed, which body is adapted to be embedded in a rail track base structure. The invention is characterized in that the element further comprises an elongated protective strip, which is connected to a side portion of the elastic body so as to leave the bottom of the elastic body exposed, and extends essentially over the length and in an upper corner region of said body. The strip has anchoring means protruding sideways from the protective strip.
