Abstract (en)

[origin: WO2007096269A1] The invention relates to a device for the real-time control of an effector, which device comprises a bleeder electrode for determining input signals from the neuronal activity of the brain of a patient and a data processing system having an evaluation unit for calculating control signals for the effector based on the input signals. The evaluation unit is adapted to the training for determining a prediction model and the calculation of the control signals from the input signals taking into consideration the prediction model. The neuronal activity is produced by natural neuronal information processing processes of the brain.
