Abstract (en)
[origin: DE102006008981A1] The system has an outer sensor (11), inner sensor (15), video sources (12, 16) that provide traffic relevant visual data, and an object detecting unit downstream to the sensors and the sources. An evaluation logic block (14) evaluates the output parameter of the object detecting unit. Output channels provide output signals via man-machine-interface-module (4). A determination unit (3) combines visual data with output signals during detection of traffic relevant objects or situation by the sensors and the sources with respect to control or influence of the interface module.
