Abstract (en)

[origin: WO2007095905A1] The invention relates to a heat exchanger comprising at least one pipe (1) and at least one lamella (2) for exchanging heat between a first coolant, which flows through the pipe (1), and a second coolant which moistens the heat exchanger due to the effect of flowing forces for cooling, and for additionally cooling a rotating machine element (3) which is arranged in a housing (4). Said heat exchanger is practically circular and essentially surrounds the rotating machine element and is integrated into the housing (4).
