Abstract (en)
[origin: EP1990496A1] The wall has a heat insulated plate arranged between external and internal wall frames (1, 2, 4). An opening is defined by an edge (Z), where the opening consists of an external heat-insulated body (5), which is laminarily connected with the external wall frame (1), and an internal heat-insulated body (6) is laminarily connected with the internal wall frames (2, 4). A heat-insulated bridge body (7) of sufficient rigidity is provided for mounting a frame of the window and/or the door, where the bridge body is connected to the heat-insulated body in an area of a heat insulated plate (3).
