Abstract (en)
[origin: EP1990587A1] A refrigerant circuit (10) includes a gas-liquid separator (15) and a compressor (30) including a low pressure side compression mechanism (34) and a high pressure side compression mechanism (35) connected to each other by means of a drive shaft (33). In the refrigerant circuit (10), a two-stage compression/two-stage expansion refrigeration cycle is performed with CO₂ refrigerant utilized as that at its critical pressure. In the compressor (30), a volume ratio V₂/V₁ of the displacement volume V₂ of the second compression mechanism (35) to that V₁ of the first compression mechanism is set within a range between 0.8 and 1.3, both exclusive.
