Abstract (en)
[origin: US2009188067A1] An attachment for a cleaning appliance includes a head including a suction opening and a neck including an intermediate portion and an end portion for connection to the mouth of a wand or hose having a longitudinal axis. The attachment also includes a first rotatable connection located between the end portion and the intermediate portion having a first axis of rotation and a second rotatable connection located between the head and the intermediate portion having a second axis of rotation. Each rotatable connection allows relative movement of the end portion with respect to the head. The first axis of rotation is inclined with respect to the longitudinal axis of the end portion. By providing such an attachment for a cleaning appliance, the head of the attachment can be moved into a variety of useful positions to allow easier cleaning of walls and high-level horizontal surfaces.
