Abstract (en)
[origin: WO2007103236A2] The invention provides expandable tubular endoluminal prostheses for the treatment of vulnerable plaque lesions and methods for treating vulnerable plaques using the prostheses. The endoprotheses may include at least two opposing ring-like end sections and a central section including a number of struts having parallel longitudinal axes connecting the ends sections. In use, the device is expanded in a blood vessel so that the central section at least partially contacts a vulnerable plaque lesion and/or the blood vessel wall in close proximity to the vulnerable plaque lesion.
