Abstract (en)
[origin: WO2007099440A1] In a vehicle body side structure, an impact beam (116) is mounted to a door inner panel (110) by an impact beam extension (118). A part of the impact beam extension (118) that extends from an impact beam fixing part (126) to the door inner panel (110) serves as a load transmission part (128) capable of transmitting a load from the impact beam (116) to the door inner panel (110), and the extension line therefrom is directed at the centroid (C2) of the body pillar (106). With a simple structure such as this, at the time of a side impact it is possible to transfer a load from the impact beam (116) in a straight line to the centroid C21 of the body pillar (106) while suppressing the twisting moment of the body pillar (106).
