Abstract (en)

[origin: WO2007099340A1] There is provided a method of signalling in an RFID network comprising active transponders and networked reader units deployed to receive communications from the transponders. The method comprises employing amplitude shift keying to encode data base on transitions between a high and a low signal according to a scheme in which respective ones of a plurality of bit combinations of binary numbers are transmitted as different predetermined delays between signal transitions.
