Abstract (en)
[origin: DE102006008281A1] The device has a support structure (1) that extends along an observation region. A set of detection sections (D1-Dn) is arranged on the structure in a sequence manner. The detection sections record detection events within an observation region zone that is defined by respective detection sections. The detection sections are formed by components of resistance-capacitance (RC) or inductance-capacitance (LC) network. The detection sections comprise an electrode unit (E1) that is arranged in such a manner that modifications of an electric field within the zone are detected by the electrode unit.
