Abstract (en)  
A hinge device between a door leaf (3) and a door frame (2) allows movement of the door leaf (3) between a closed position and an openable position in which the door leaf (3) is pivotable. The door leaf (3) engages in said closed position an engaging means (13) arranged in the door frame (2) at a distance from the hinge device. The hinge device has a lock mechanism (16) which in a locked position prevents movement of the door leaf (3) from said closed position to said openable position, and which in an unlocked position allows movement of the door leaf (3) from said closed position to said openable position.
