Abstract (en)

[origin: FR2897599A1] The assembly has a collyrium distribution device (6) comprising a microporous liquid and air filtration membrane (28) that extends through a passage (26). A part (24) has a tubular sleeve (37) inserted in a sealed manner into a neck (12). An annular elastic lip (38), is made of a same material of the sleeve and extends in radial projection towards the exterior from the sleeve. A porous material e.g. compressible foam, block (39) permits the passage of a liquid e.g. collyrium, and contacts with a side (28a) of the membrane. The block extends along a section of the passage.
