Abstract (en)

[origin: WO2007104849A1] Roller shutter installation in a building opening surmounted by a lintel (1) having a cutout (2) which is open to the inside of the building for fitting, from the inside, a roller shutter mounted on a winding shaft which is supported in the vicinity of each end by a side piece (4) fastened at the upper part of a fixed joinery frame (6). The cutout (2) in the lintel is also open to the bottom; the side pieces (4), together with the joinery frame, form half a combination unit, and the housing for the shutter is bounded to the inside of the building by a board (11) which is intended to be covered by a non-detachable inner lining after finishing; a detachable outer inspection hatch (4) closes the cutout to the bottom, and a means (15) for fastening the outer hatch is connected adjustably, at least in terms of height, to the lower part of each side piece (4), each of the transverse ends of the outer inspection hatch (14) being connected to the corresponding fastening means (15).
