Abstract (en)
[origin: WO2007101416A1] The invention relates to a valve (101) having a rotary slide (103). The rotary slide comprises a line space (117) which is connected to a first inlet (106) and, by varying the rotational position, can be selectively connected to one of a plurality of outlets (107). The rotary slide is designed such that the area ratios ensure, in the event of pressure loading, that a partial pressure equalization always takes place.
