Abstract (en)
[origin: WO2007104411A1] The invention relates to a power disconnecting device comprising a switch (2) that can be actuated by means of at least one auxiliary drive unit and is provided with switching contacts (4, 5). In order to make said power disconnecting device compact and lightweight while being able to adjust the same to different applications, the power disconnecting device comprises an additional manually operated positive opening mechanism (7) which acts upon the switching contacts of the switch. The inventive power disconnecting device thus uses one switching point less than conventional power disconnecting and grounding devices and can be designed in a more compact fashion.
