Abstract (en)
[origin: EP1995738A1] The electrical conductor (L) is made up of an electrically conducting material containing aluminum and is surrounded by a protective layer (3) serving as corrosion protection in an area provided for the connection of an electric contact element. The conducting material is formed around a steel wire (1) with a diameter between 0.05 millimeter and 0.2 millimeter and fracture strength of 1000 Newton per square millimeter. The protective layer consists of tin, nickel or silver. An independent claim is also included for a method for manufacturing a conductor.
