Abstract (en)

An object of the present invention is to prevent an inadvertent movement of a wire cover resulting from the operation of a lever. A wire cover 30 and a housing 10 are provided with contact means (projection-shaped receiving portions 17, projection-shaped contact portions 38, step-shaped receiving portions 20 and step-shaped contact portions 39) capable of preventing the wire cover 30 from moving relative to the housing 10 in directions substantially parallel to a displacing direction of the operation 42 according to the rotation of a lever 40. In the process of assembling the wire cover 30 in a direction substantially orthogonal to the rear surface (wire draw-out surface 12, mounting surface 13) of the housing 10, lock means (lock portions 14, hooking portions 37) are engaged with each other while resiliently deforming the wire cover 30 and, by this engaging action, the wire cover 30 is prevented from being separated from the housing 10 in a direction substantially orthogonal to the rear surface of the housing 10.
