Abstract (en)

[origin: WO2007107645A1] The present invention relates to a process for reading the contour of the groove (10A) of a spectacle frame (10) rim comprising a step of contacting a probe (8) against the groove (10A) and a step of sensing the groove (10A) by sliding or rolling said probe (8) along the groove (10A), the position of the probe (8) being determined and the velocity of the probe (8) comprising first, second and third components (VP, VR, VZ). According to the invention, the first component (VP) of the velocity of the probe (8) is controlled dynamically to vary, continuously or in steps, in the course of reading as a function of at least one or both of the second and third components (VR, VZ) of the velocity of the probe (8).
