Abstract (en)

[origin: EP1997590A1] The tool has an actuation switch (13) and a connector (16). Three blocking members (55a, 55b, 55c) are moveable in three separate channels (56), and a recess (51) is provided on a switching element (34) to receive the blocking members and which opens toward a structural component (33). The channels (56) are inclined with respect to a plane (E) extending perpendicular to the longitudinal axis (A). The channels intersect, in some regions, an axial projection of the first switching element in form of a secant and are open toward the first switching element in respective overlapping regions (59).
