Abstract (en)

[origin: WO2007117398A2] One of the most universal characteristics of malignant tumors is their acidity. Onco-tools are small non-peptide synthetic molecules designed to exploit this acidity for early detection and destruction of tumors. Each onco-tool has a structure which is anionic and hydrophilic at pH 7.4 and so repels from the negatively-charged surfaces of cells in normal tissues. When an onco-tool enters an acidic environment, such as in a tumor, a portion of the onco-tool molecules switch to their non-ionic lipophilic form which is designed to enter cells, such as cells in acidic areas of tumors. Prior to use of an onco-tool, a selected radioisotope is linked to the onco-tool. If that radioisotope emits radiation which can be detected outside the body, then the onco-tool can serve for detecting tumors. If that radioisotope emits radiation effective to kill cells, then the onco-tool can serve for treating tumors.
