Abstract (en)
[origin: WO2007104066A2] The invention relates to a detachable holding device (1) for a component (2), comprising at least one connecting element (3). Said connecting element (3) is constituted of at least two rod-shaped profiles (4) with polygonal cross-section. The connecting elements (3) are held in the component (2) in recesses (5) via a pressure fit without requiring additional components and consist of a material with a flexural strength higher than that of wood. The recesses extend approximately in parallel to each other, have an at least approximately circular cross-section and receive the profiles.
