Abstract (en)

[origin: WO2007107138A1] The invention relates to a torque transmitting device having an input part and an output part which in each case can be connected to a rotatable shaft and are coupled in terms of drive by means of at least one intermediate element which permits a radial displacement of the two parts, wherein the intermediate element is coupled by means of at least two radially elastic regions (9, 10), which permit radial displacement, on the one hand to the input part (3) and on the other hand to the output part (4).
