Abstract (en)  
[origin: WO2007098421A2] A universal distributed search system allows users to find and distribute search results to those with whom they communicate. The search results can be easily distributed by the user via a simple interface that allows the search results to be easily added to the user's content. Search queries entered by the user or search results received from search components may be automatically refined by the system. Search queries may also be automatically generated by the system.
